Effects of ethosuximide on morphine tolerance and dependence in mice

Imenshahidi, M.^b, Hosseinzadeh, H.^a, Es'haghian, A.^b^a Pharmaceutical Research Center, Pharmacodynamics and Toxicology Department, Mashhad University of Medical Sciences, Mashhad, Iran^b Department of Pharmacodynamics and Toxicology, School of Pharmacy, Mashhad University of Medical Sciences, Mashhad, Iran

Abstract

[View references \(23\)](#)

In the present study, the effects of ethosuximide (an anticonvulsant with T-type calcium channel blocking activity) on the expression and development of morphine antinociceptive tolerance, and naloxone-precipitated abstinence syndrome in morphine dependent mice were investigated. Mice were rendered tolerant and dependent on morphine by repeated administration of morphine. The tail-flick test was used to assess the nociceptive threshold, naloxone-induced jumping to assess the morphine dependence and open field to evaluate the locomotion. Repeated administration of ethosuximide (100, 200 and 400 mg/kg, 2 time/day for 4 day) and also single administration of ethosuximide (100 mg/kg, simultaneously with last dose of morphine) reduced the development and expression of tolerance to the antinociceptive effect of morphine. Repeated administration of ethosuximide (100, 200 and 400 mg/kg, 3 time / day for 3 day) and also single administration of ethosuximide (100, 200 and 400 mg/kg, 30 min before the last dose of morphine) reduced the development and expression of naloxone-induced jumping in dependent mice that was comparable with clonidine (0.1 mg/kg) as positive control. Single (200 and 400 mg/kg) and repeated (only in 400 mg/ kg) administration of ethosuximide reduced the activity of animals in open field test. Ethosuximide in 200 and 400 mg/kg had direct antinociceptive effect that wasn't blocked by naloxone. These results showed that ethosuximide, a relatively selective T-type calcium channel blocker has direct antinociceptive effect, prevents the development and expression of antinociceptive tolerance to morphine and suppress morphine withdrawal syndrome.
