### Abstract

Brucellosis is a common and serious infectious disease in many parts of the world. Skeletal complications are reported in the majority of cases with Brucellosis and include arthritis, spondylitis, osteomyelitis, tenosynovitis, and bursitis. Pubic bone involvement is very rare in Brucellosis and there are only two case reports in the literature. We here report two patients with osteomyelitis of the pubic bones due to Brucellosis.

### Reaxys Database Information

### Author keywords

Brucellosis; Osteomyelitis; Pubic bone

### Indexed Keywords

**EMTREE drug terms:** cefalotin; doxycycline; medronate technetium tc 99m; rifampicin; streptomycin

**EMTREE medical terms:** adult; aged; agglutination test; anamnesis; anemia; article; bone radiography; bone scintiscanning; brucellosis; case report; clinical feature; computer assisted tomography; drug efficacy; erythrocyte sedimentation rate; female; human; leukopenia; osteomyelitis; osteosderosis; pubic bone

**Chemicals and CAS Registry Numbers:** cefalotin, 103-71-7, 08-71-9; doxycycline, 1092-13-9, 17086-28-1, 064-20-0; rifampicin, 13292-87-1; streptomycin, 07-92-1
